

PANTOGRAPH

Technical data / extra information sheet

Mechanical Theatre Equipment Compliance Portal

Purpose of this sheet

A technical record template for this equipment. Complete and review it using the actual manufacturer instructions, installation design, inspection records and site assessment. It does not certify an asset or assign a load rating.

1. Equipment identification

Field	Details
Equipment name	Pantograph
Equipment category	General Equipment / Audio Suspension
Manufacturer / supplier	To be confirmed for the actual asset.
Model / product variant	To be confirmed; include part number and version.
Asset / serial / batch ID	To be completed; attach a photograph of identification markings.
Site / location	To be completed.
Owner / responsible person	To be completed.
Status / record date	Generic template - asset details and approval outstanding. Date: _____

2. Description and typical use

An articulated scissor mechanism used to vary the height of supported equipment. Spring-balanced and other versions require the correct payload range and controlled adjustment procedures.

- Use only within the identified model's extension and balance range.
- Adjustment or repair involving stored spring energy requires the manufacturer's procedure and competent personnel.

3. Technical data to confirm

Enter confirmed values and the document/drawing reference in the asset record. WLL means working load limit. No numerical load rating is assigned by this sheet.

Parameter	Required confirmation
Model/variant	Record extension range, spring arrangement and original product instructions.
Payload range	Confirm minimum/maximum payload for the fitted balance system and accessories.
Top/bottom interfaces	Identify mounting receivers/spigots and their locking/retention methods.
Balance setup	Record spring settings and approved adjustment/attachment procedure.
Motion envelope	Record vertical travel, clearances and protection from pinch points.
Cable management	Record cable routing, strain relief, secondary retention and travel allowance.
Operating limits	Record all manufacturer/designer restrictions and the approved load arrangement.
Inspection / maintenance	Record pre-use checks, periodic inspections and servicing responsibilities; use the exact product instructions.
Documents / traceability	Attach applicable instructions, drawings, certificates and inspection/examination reports. Record reference and revision.

Important limitation

Do not dismantle or improvise repairs to a spring-loaded mechanism. Confirm the safe position and method before attaching or removing its load.

4. Regulatory and good practice context

Topic	Application to record
Work equipment	Apply relevant PUWER duties for suitability, maintenance, inspection and safe use.
Lifting equipment	Assess whether the actual mechanism raises/lowers a load and falls within LOLER. Manual adjustment or the asset name alone is not a classification decision.
Standards / instructions	Identify relevant product/structural standards and any BS EN 17206 machinery interface. Confirm applicable editions and scope; use maker/designer limits.

5. Pre-use and periodic inspection

Use competent personnel and a safe inspection method. These checks support the asset-specific regime; they do not replace maintenance or a statutory thorough examination. Record Pass / Fail / N/A and findings.

Check	What to confirm	Result / notes
Identification/records	Asset and configuration identifiable; instructions and previous defect actions available.	
Scissor links/pivots	No bent links, cracking, loose joints or excessive play.	
Springs/balance	No damaged or displaced springs; movement controlled in the approved range.	
Mountings	Secure top/bottom interfaces and required secondary retention.	
Travel/cables	No snagging, trapped cables or collision through the intended travel.	
Change or damage history	Check for overload, impact, modification, repair or changed environment since last assessment.	
Safe function check	Where applicable, verify intended operation using an authorised safe procedure; do not improvise a proof-load test.	
Outcome/actions	Record defects, restrictions and actions; confirm who authorises return to use.	

6. Removal from service triggers

- Uncontrolled motion, loss of balance or damaged spring/link components.
- Insecure mounting, excessive pivot play or cable damage caused by travel.
- Damage, wear, corrosion or malfunction beyond the manufacturer/designer acceptance criteria, or uncertainty about safe condition.
- Suspected overload, significant impact or an unapproved modification: isolate the affected asset pending competent assessment.
- Tag and prevent use of unsafe equipment; record the defect and authorised repair/replacement and reinspection before return.

Inspection planning

Where LOLER applies, record the correct examination interval or a competent person's written scheme. Do not assume that an annual visual check is sufficient for every asset. Include examinations after relevant exceptional events.

7. Site-specific notes and limitations

Topic	Site entry / supporting document reference
Permitted loads / uses	
Prohibited uses / limits	
Location / environment	
Inspection / servicing plan	
Related assets / drawings	

8. Inspection and document record

Date	Check / document	Completed by	Outcome / action

Asset details verified by: _____ Date: _____

Release / approval reference: _____
