

PIPE HANGING CLAMP

Technical data / extra information sheet

Mechanical Theatre Equipment Compliance Portal

Purpose of this sheet

A technical record template for this equipment. Complete and review it using the actual manufacturer instructions, installation design, inspection records and site assessment. It does not certify an asset or assign a load rating.

1. Equipment identification

Field	Details
Equipment name	Pipe Hanging Clamp
Equipment category	Accessories
Manufacturer / supplier	To be confirmed for the actual asset.
Model / product variant	To be confirmed; include part number and version.
Asset / serial / batch ID	To be completed; attach a photograph of identification markings.
Site / location	To be completed.
Owner / responsible person	To be completed.
Status / record date	Generic template - asset details and approval outstanding. Date: _____

2. Description and typical use

A clamp used in a documented pipe or bar suspension arrangement. The name covers different designs, so the exact clamp and its approved suspension connection must be identified.

- Use only for the attachment and load direction allowed for the identified product.
- Record the supported equipment and the complete load path to the building or lifting system.

3. Technical data to confirm

Enter confirmed values and the document/drawing reference in the asset record. WLL means working load limit. No numerical load rating is assigned by this sheet.

Parameter	Required confirmation
Clamp design	Identify the product and whether it is intended for overhead suspension.
Pipe fit	Confirm permitted outside diameter, material and wall thickness where specified.
Suspension interface	Record eye, bolt, stud or other connection and its allowed direction of pull.
Closure and locking	Record the specified bolts, torque/method and retention features.
Load rating	Confirm rating for the actual suspension arrangement, including any side-load restriction.
Support spacing	Record clamp locations and reactions for the supported pipe.
Operating limits	Record all manufacturer/designer restrictions and the approved load arrangement.
Inspection / maintenance	Record pre-use checks, periodic inspections and servicing responsibilities; use the exact product instructions.
Documents / traceability	Attach applicable instructions, drawings, certificates and inspection/examination reports. Record reference and revision.

Important limitation

Do not assume a plumbing pipe clip or a visually similar clamp is suitable for suspending equipment overhead.

4. Regulatory and good practice context

Topic	Application to record
Work equipment	Apply relevant PUWER duties for suitability, maintenance, inspection and safe use.
Lifting equipment	Assess the actual role in any lifting system. A fixed support or structural component should not be classified solely from its name or portal category.
Standards / instructions	Identify relevant product/structural standards and any BS EN 17206 machinery interface. Confirm applicable editions and scope; use maker/designer limits.

5. Pre-use and periodic inspection

Use competent personnel and a safe inspection method. These checks support the asset-specific regime; they do not replace maintenance or a statutory thorough examination. Record Pass / Fail / N/A and findings.

Check	What to confirm	Result / notes
Identification/records	Asset and configuration identifiable; instructions and previous defect actions available.	
Closure	Clamp assembled in its intended orientation with all closure parts fitted.	
Contact surfaces	No corrosion, contamination, distortion or damage affecting grip.	
Suspension connection	Correct mating hardware; no bending or cross-loading.	
Pipe condition	No crushing, cracks or local deformation at the clamp.	
Change or damage history	Check for overload, impact, modification, repair or changed environment since last assessment.	
Safe function check	Where applicable, verify intended operation using an authorised safe procedure; do not improvise a proof-load test.	
Outcome/actions	Record defects, restrictions and actions; confirm who authorises return to use.	

6. Removal from service triggers

- Unidentified clamp, incomplete closure or inability to secure it to the correct tube.
- Movement at the grip, deformed suspension connection or damage to the pipe.
- Damage, wear, corrosion or malfunction beyond the manufacturer/designer acceptance criteria, or uncertainty about safe condition.
- Suspected overload, significant impact or an unapproved modification: isolate the affected asset pending competent assessment.
- Tag and prevent use of unsafe equipment; record the defect and authorised repair/replacement and reinspection before return.

Inspection planning

Where LOLER applies, record the correct examination interval or a competent person's written scheme. Do not assume that an annual visual check is sufficient for every asset. Include examinations after relevant exceptional events.

7. Site-specific notes and limitations

Topic	Site entry / supporting document reference
Permitted loads / uses	
Prohibited uses / limits	
Location / environment	
Inspection / servicing plan	
Related assets / drawings	

8. Inspection and document record

Date	Check / document	Completed by	Outcome / action

Asset details verified by: _____ Date: _____

Release / approval reference: _____
