

PROJECTOR BRACKET

Technical data / extra information sheet

Mechanical Theatre Equipment Compliance Portal

Purpose of this sheet

A technical record template for this equipment. Complete and review it using the actual manufacturer instructions, installation design, inspection records and site assessment. It does not certify an asset or assign a load rating.

1. Equipment identification

Field	Details
Equipment name	Projector Bracket
Equipment category	General Equipment / Audio Suspension
Manufacturer / supplier	To be confirmed for the actual asset.
Model / product variant	To be confirmed; include part number and version.
Asset / serial / batch ID	To be completed; attach a photograph of identification markings.
Site / location	To be completed.
Owner / responsible person	To be completed.
Status / record date	Generic template - asset details and approval outstanding. Date: _____

2. Description and typical use

A bracket supporting a projector from a wall, ceiling or other approved structure. The projector mounting points and adjustable bracket joints must be suitable for the full assembly.

- Use an approved bracket/equipment combination in the recorded orientation.
- Verify the supporting structure and its fixings as well as the bracket itself.

3. Technical data to confirm

Enter confirmed values and the document/drawing reference in the asset record. WLL means working load limit. No numerical load rating is assigned by this sheet.

Parameter	Required confirmation
Projector match	Record projector model, mass, mounting pattern and approved mounting points.
Bracket geometry	Record arm/drop length, extension, tilt and the resulting load offset.
Capacity and environment	Confirm capacity in this orientation and ventilation/clearance requirements.
Structure and anchors	Record substrate, anchor type, installation details and design reactions.
Equipment fasteners	Record approved fasteners, engagement, torque/method and locking.
Adjustment locks	Identify all tilt/swivel/extension locks and any required secondary restraint.
Operating limits	Record all manufacturer/designer restrictions and the approved load arrangement.
Inspection / maintenance	Record pre-use checks, periodic inspections and servicing responsibilities; use the exact product instructions.
Documents / traceability	Attach applicable instructions, drawings, certificates and inspection/examination reports. Record reference and revision.

Important limitation

A universal-looking mounting pattern does not prove compatibility. Confirm the projector manufacturer permits this suspension method.

4. Regulatory and good practice context

Topic	Application to record
Work equipment	Apply relevant PUWER duties for suitability, maintenance, inspection and safe use.
Lifting equipment	Assess the actual role in any lifting system. A fixed support or structural component should not be classified solely from its name or portal category.
Standards / instructions	Identify relevant product/structural standards and any BS EN 17206 machinery interface. Confirm applicable editions and scope; use maker/designer limits.

5. Pre-use and periodic inspection

Use competent personnel and a safe inspection method. These checks support the asset-specific regime; they do not replace maintenance or a statutory thorough examination. Record Pass / Fail / N/A and findings.

Check	What to confirm	Result / notes
Identification/records	Asset and configuration identifiable; instructions and previous defect actions available.	
Projector attachment	Approved holes and fasteners used; no damaged inserts or insecure arms.	
Cables and cooling	Cables do not pull the mount; ventilation and service access maintained.	
Fixing condition	No loose anchors, cracking of substrate or movement at the mounting.	
Body and joints	No deformation, cracking, damaged threads or insecure adjustment joints.	
Change or damage history	Check for overload, impact, modification, repair or changed environment since last assessment.	
Safe function check	Where applicable, verify intended operation using an authorised safe procedure; do not improvise a proof-load test.	
Outcome/actions	Record defects, restrictions and actions; confirm who authorises return to use.	

6. Removal from service triggers

- Loose or moving support fixing, damaged bracket or an ineffective adjustment lock.
- Unverified equipment compatibility, altered load position or missing required retention.
- Damage, wear, corrosion or malfunction beyond the manufacturer/designer acceptance criteria, or uncertainty about safe condition.
- Suspected overload, significant impact or an unapproved modification: isolate the affected asset pending competent assessment.
- Tag and prevent use of unsafe equipment; record the defect and authorised repair/replacement and reinspection before return.

Inspection planning

Where LOLER applies, record the correct examination interval or a competent person's written scheme. Do not assume that an annual visual check is sufficient for every asset. Include examinations after relevant exceptional events.

7. Site-specific notes and limitations

Topic	Site entry / supporting document reference
Permitted loads / uses	
Prohibited uses / limits	
Location / environment	
Inspection / servicing plan	
Related assets / drawings	

8. Inspection and document record

Date	Check / document	Completed by	Outcome / action

Asset details verified by: _____ Date: _____

Release / approval reference: _____
