

LIGHTING STAND

Technical data / extra information sheet

Mechanical Theatre Equipment Compliance Portal

Purpose of this sheet

A technical record template for this equipment. Complete and review it using the actual manufacturer instructions, installation design, inspection records and site assessment. It does not certify an asset or assign a load rating.

1. Equipment identification

Field	Details
Equipment name	Lighting Stand
Equipment category	Accessories
Manufacturer / supplier	To be confirmed for the actual asset.
Model / product variant	To be confirmed; include part number and version.
Asset / serial / batch ID	To be completed; attach a photograph of identification markings.
Site / location	To be completed.
Owner / responsible person	To be completed.
Status / record date	Generic template - asset details and approval outstanding. Date: _____

2. Description and typical use

A freestanding support for lighting equipment at a documented height and load position. This sheet covers a lighting support stand; any lifting mechanism also needs its own operating and inspection information.

- Use the documented height, leg spread and equipment arrangement for the identified stand.
- Confirm stability on the actual floor or ground, including any required restraints or approved ballast.

3. Technical data to confirm

Enter confirmed values and the document/drawing reference in the asset record. WLL means working load limit. No numerical load rating is assigned by this sheet.

Parameter	Required confirmation
Stand type	Record tripod/base design, manufacturer and whether height adjustment raises a load.
Payload and height	Confirm permitted payload for each extension and load offset used.
Footprint/base	Record full leg spread, base dimensions, approved ballast and floor requirements.
Extension locks	Record pins, collars, positive locks and their engagement requirements.
Top attachment	Identify spigot/socket, bar adaptor and permitted fixture arrangement.
Environment	Confirm indoor/outdoor suitability and any stated wind or weather limits.
Operating limits	Record all manufacturer/designer restrictions and the approved load arrangement.
Inspection / maintenance	Record pre-use checks, periodic inspections and servicing responsibilities; use the exact product instructions.
Documents / traceability	Attach applicable instructions, drawings, certificates and inspection/examination reports. Record reference and revision.

Important limitation

A Lighting Stand is not automatically a Lifting Stand. Identify any winch or lifting function and assess that function separately.

4. Regulatory and good practice context

Topic	Application to record
Work equipment	Apply relevant PUWER duties for suitability, maintenance, inspection and safe use.
Lifting equipment	Assess whether the actual mechanism raises/lowers a load and falls within LOLER. Manual adjustment or the asset name alone is not a classification decision.
Standards / instructions	Identify relevant product/structural standards and any BS EN 17206 machinery interface. Confirm applicable editions and scope; use maker/designer limits.

5. Pre-use and periodic inspection

Use competent personnel and a safe inspection method. These checks support the asset-specific regime; they do not replace maintenance or a statutory thorough examination. Record Pass / Fail / N/A and findings.

Check	What to confirm	Result / notes
Identification/records	Asset and configuration identifiable; instructions and previous defect actions available.	
Legs/base	Fully deployed on suitable level support; no rocking or damaged feet.	
Mast and locks	Straight sections; pins and locks fully engage without slipping.	
Top load	Secure compatible attachment; load and offset within the documented limits.	
Public access/cables	Protect against collision and trips; cables do not pull the stand over.	
Change or damage history	Check for overload, impact, modification, repair or changed environment since last assessment.	
Safe function check	Where applicable, verify intended operation using an authorised safe procedure; do not improvise a proof-load test.	
Outcome/actions	Record defects, restrictions and actions; confirm who authorises return to use.	

6. Removal from service triggers

- Bent mast or leg, failed lock, cracked base or unstable setup.
- Unknown load/height limit, unsuitable ground or weather outside the approved conditions.
- Damage, wear, corrosion or malfunction beyond the manufacturer/designer acceptance criteria, or uncertainty about safe condition.
- Suspected overload, significant impact or an unapproved modification: isolate the affected asset pending competent assessment.
- Tag and prevent use of unsafe equipment; record the defect and authorised repair/replacement and reinspection before return.

Inspection planning

Where LOLER applies, record the correct examination interval or a competent person's written scheme. Do not assume that an annual visual check is sufficient for every asset. Include examinations after relevant exceptional events.

7. Site-specific notes and limitations

Topic	Site entry / supporting document reference
Permitted loads / uses	
Prohibited uses / limits	
Location / environment	
Inspection / servicing plan	
Related assets / drawings	

8. Inspection and document record

Date	Check / document	Completed by	Outcome / action

Asset details verified by: _____ Date: _____

Release / approval reference: _____
