

# TEMPORARY STAGING

## Technical data / extra information sheet

### Mechanical Theatre Equipment Compliance Portal

#### Purpose of this sheet

A technical record template for this equipment. Complete and review it using the actual manufacturer instructions, installation design, inspection records and site assessment. It does not certify an asset or assign a load rating.

## 1. Equipment identification

| Field                      | Details                                                                |
|----------------------------|------------------------------------------------------------------------|
| Equipment name             | Temporary Staging                                                      |
| Equipment category         | General Equipment / Audio Suspension                                   |
| Manufacturer / supplier    | To be confirmed for the actual asset.                                  |
| Model / product variant    | To be confirmed; include part number and version.                      |
| Asset / serial / batch ID  | To be completed; attach a photograph of identification markings.       |
| Site / location            | To be completed.                                                       |
| Owner / responsible person | To be completed.                                                       |
| Status / record date       | Generic template - asset details and approval outstanding. Date: _____ |

## 2. Description and typical use

A temporary platform assembled from compatible decks, supports and associated access/protection components. Its safe capacity and stability depend on the complete layout, height, ground conditions and intended activity.

- Use a documented layout with suitable access and edge protection for the activity.
- Account for people, scenery, concentrated loads, movement and any outdoor exposure.

### 3. Technical data to confirm

Enter confirmed values and the document/drawing reference in the asset record. WLL means working load limit. No numerical load rating is assigned by this sheet.

| Parameter                | Required confirmation                                                                                                        |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Deck/support system      | Record manufacturer, deck sizes, leg/underframe type and connection system.                                                  |
| Layout and height        | Attach plan, heights, joints, access routes and changes of level.                                                            |
| Design loading           | Confirm distributed and concentrated loads, dynamic activity and edge-load limits.                                           |
| Stability/bracing        | Record required bracing, restraints and permitted freestanding arrangements.                                                 |
| Ground and bearing       | Record floor/ground capacity, levelling, sole plates and settlement checks.                                                  |
| Access/protection        | Record steps/ramps, guardrails, handrails and any designed edge-protection exceptions.                                       |
| Operating limits         | Record all manufacturer/designer restrictions and the approved load arrangement.                                             |
| Inspection / maintenance | Record pre-use checks, periodic inspections and servicing responsibilities; use the exact product instructions.              |
| Documents / traceability | Attach applicable instructions, drawings, certificates and inspection/examination reports.<br>Record reference and revision. |

#### Important limitation

A deck's distributed-load rating does not establish concentrated-load, guardrail or whole-stage capacity. Record a competent design/assembly assessment for the actual staging.

### 4. Regulatory and good practice context

| Topic                    | Application to record                                                                                                                                     |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Work equipment           | Apply relevant PUWER duties for suitability, maintenance, inspection and safe use.                                                                        |
| Lifting equipment        | Assess the actual role in any lifting system. A fixed support or structural component should not be classified solely from its name or portal category.   |
| Standards / instructions | Identify relevant product/structural standards and any BS EN 17206 machinery interface. Confirm applicable editions and scope; use maker/designer limits. |

## 5. Pre-use and periodic inspection

Use competent personnel and a safe inspection method. These checks support the asset-specific regime; they do not replace maintenance or a statutory thorough examination. Record Pass / Fail / N/A and findings.

| Check                           | What to confirm                                                                                                     | Result / notes |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------|----------------|
| <b>Identification/records</b>   | Asset and configuration identifiable; instructions and previous defect actions available.                           |                |
| <b>Deck surfaces/joints</b>     | Secure, even surfaces with no damaged boards, gaps or loose connectors.                                             |                |
| <b>Legs and bracing</b>         | Correct height settings, locks and braces; no unsupported or moving deck.                                           |                |
| <b>Ground/supports</b>          | No rocking, settlement, unsuitable packing or impaired bearing.                                                     |                |
| <b>Access/edges</b>             | Secure steps and protective components; routes and clearances maintained.                                           |                |
| <b>Change or damage history</b> | Check for overload, impact, modification, repair or changed environment since last assessment.                      |                |
| <b>Safe function check</b>      | Where applicable, verify intended operation using an authorised safe procedure; do not improvise a proof-load test. |                |
| <b>Outcome/actions</b>          | Record defects, restrictions and actions; confirm who authorises return to use.                                     |                |

## 6. Removal from service triggers

- Instability, ground settlement, damaged deck or missing structural connectors/bracing.
- Unsafe access/edges, changed layout or load/activity outside the design.
- Damage, wear, corrosion or malfunction beyond the manufacturer/designer acceptance criteria, or uncertainty about safe condition.
- Suspected overload, significant impact or an unapproved modification: isolate the affected asset pending competent assessment.
- Tag and prevent use of unsafe equipment; record the defect and authorised repair/replacement and reinspection before return.

### Inspection planning

Where LOLER applies, record the correct examination interval or a competent person's written scheme. Do not assume that an annual visual check is sufficient for every asset. Include examinations after relevant exceptional events.

## 7. Site-specific notes and limitations

| Topic                       | Site entry / supporting document reference |
|-----------------------------|--------------------------------------------|
| Permitted loads / uses      |                                            |
| Prohibited uses / limits    |                                            |
| Location / environment      |                                            |
| Inspection / servicing plan |                                            |
| Related assets / drawings   |                                            |

## 8. Inspection and document record

| Date | Check / document | Completed by | Outcome / action |
|------|------------------|--------------|------------------|
|      |                  |              |                  |
|      |                  |              |                  |
|      |                  |              |                  |
