

# TWISTED BOOM ARM

## Technical data / extra information sheet

### Mechanical Theatre Equipment Compliance Portal

#### Purpose of this sheet

A technical record template for this equipment. Complete and review it using the actual manufacturer instructions, installation design, inspection records and site assessment. It does not certify an asset or assign a load rating.

## 1. Equipment identification

| Field                      | Details                                                                |
|----------------------------|------------------------------------------------------------------------|
| Equipment name             | Twisted Boom Arm                                                       |
| Equipment category         | Accessories                                                            |
| Manufacturer / supplier    | To be confirmed for the actual asset.                                  |
| Model / product variant    | To be confirmed; include part number and version.                      |
| Asset / serial / batch ID  | To be completed; attach a photograph of identification markings.       |
| Site / location            | To be completed.                                                       |
| Owner / responsible person | To be completed.                                                       |
| Status / record date       | Generic template - asset details and approval outstanding. Date: _____ |

## 2. Description and typical use

An offset support with a twisted or differently oriented end connection, used to position equipment away from its supporting bar. The offset creates a moment at the attachment; allowable load depends on the exact geometry and orientation.

- Use only for the attachment and load direction allowed for the identified product.
- Record the supported equipment and the complete load path to the building or lifting system.

### 3. Technical data to confirm

Enter confirmed values and the document/drawing reference in the asset record. WLL means working load limit. No numerical load rating is assigned by this sheet.

| Parameter                | Required confirmation                                                                                                        |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Arm geometry             | Record length, section, offset and twist/end orientation.                                                                    |
| End connections          | Identify both clamps/adaptors, tube sizes and approved fastening methods.                                                    |
| Load position            | Record fixture mass, centre of gravity and distance from the support axis.                                                   |
| Rated arrangement        | Confirm allowable load/moment for the actual projection and orientation.                                                     |
| Anti-rotation            | Record how rotation or slip at the attachment is controlled.                                                                 |
| Clearance                | Record operating envelope, adjacent equipment and cable support.                                                             |
| Operating limits         | Record all manufacturer/designer restrictions and the approved load arrangement.                                             |
| Inspection / maintenance | Record pre-use checks, periodic inspections and servicing responsibilities; use the exact product instructions.              |
| Documents / traceability | Attach applicable instructions, drawings, certificates and inspection/examination reports.<br>Record reference and revision. |

#### Important limitation

A twisted arm is not interchangeable with a straight arm: loading may act in more than one plane.

### 4. Regulatory and good practice context

| Topic                    | Application to record                                                                                                                                     |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Work equipment           | Apply relevant PUWER duties for suitability, maintenance, inspection and safe use.                                                                        |
| Lifting equipment        | Assess the actual role in any lifting system. A fixed support or structural component should not be classified solely from its name or portal category.   |
| Standards / instructions | Identify relevant product/structural standards and any BS EN 17206 machinery interface. Confirm applicable editions and scope; use maker/designer limits. |

## 5. Pre-use and periodic inspection

Use competent personnel and a safe inspection method. These checks support the asset-specific regime; they do not replace maintenance or a statutory thorough examination. Record Pass / Fail / N/A and findings.

| Check                           | What to confirm                                                                                                     | Result / notes |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------|----------------|
| <b>Identification/records</b>   | Asset and configuration identifiable; instructions and previous defect actions available.                           |                |
| <b>Arm and joints</b>           | No bends, cracks, damaged welds or corrosion affecting strength.                                                    |                |
| <b>Support clamp</b>            | Correct fit and secure attachment; no rotation or witness marks from slip.                                          |                |
| <b>Outer fitting</b>            | Secure equipment connection with suitable retention.                                                                |                |
| <b>Load geometry</b>            | Actual offset and twisted-end orientation matches the documented arrangement.                                       |                |
| <b>Change or damage history</b> | Check for overload, impact, modification, repair or changed environment since last assessment.                      |                |
| <b>Safe function check</b>      | Where applicable, verify intended operation using an authorised safe procedure; do not improvise a proof-load test. |                |
| <b>Outcome/actions</b>          | Record defects, restrictions and actions; confirm who authorises return to use.                                     |                |

## 6. Removal from service triggers

- Permanent deformation, cracking or any unexpected rotation under the intended load.
- Increased projection/offset or substituted fittings without a confirmed rating.
- Damage, wear, corrosion or malfunction beyond the manufacturer/designer acceptance criteria, or uncertainty about safe condition.
- Suspected overload, significant impact or an unapproved modification: isolate the affected asset pending competent assessment.
- Tag and prevent use of unsafe equipment; record the defect and authorised repair/replacement and reinspection before return.

### Inspection planning

Where LOLER applies, record the correct examination interval or a competent person's written scheme. Do not assume that an annual visual check is sufficient for every asset. Include examinations after relevant exceptional events.

## 7. Site-specific notes and limitations

| Topic                       | Site entry / supporting document reference |
|-----------------------------|--------------------------------------------|
| Permitted loads / uses      |                                            |
| Prohibited uses / limits    |                                            |
| Location / environment      |                                            |
| Inspection / servicing plan |                                            |
| Related assets / drawings   |                                            |

## 8. Inspection and document record

| Date | Check / document | Completed by | Outcome / action |
|------|------------------|--------------|------------------|
|      |                  |              |                  |
|      |                  |              |                  |
|      |                  |              |                  |
