

U BOLT

Technical data / extra information sheet

Mechanical Theatre Equipment Compliance Portal

Purpose of this sheet

A technical record template for this equipment. Complete and review it using the actual manufacturer instructions, installation design, inspection records and site assessment. It does not certify an asset or assign a load rating.

1. Equipment identification

Field	Details
Equipment name	U Bolt
Equipment category	Accessories
Manufacturer / supplier	To be confirmed for the actual asset.
Model / product variant	To be confirmed; include part number and version.
Asset / serial / batch ID	To be completed; attach a photograph of identification markings.
Site / location	To be completed.
Owner / responsible person	To be completed.
Status / record date	Generic template - asset details and approval outstanding. Date: _____

2. Description and typical use

A U-shaped threaded fastening used with an appropriate saddle or plate to retain a component. Material, bend geometry and assembly determine its suitability.

- Use only for the attachment and load direction allowed for the identified product.
- Record the supported equipment and the complete load path to the building or lifting system.

3. Technical data to confirm

Enter confirmed values and the document/drawing reference in the asset record. WLL means working load limit. No numerical load rating is assigned by this sheet.

Parameter	Required confirmation
Product/grade	Record manufacturer, material grade, coating and traceability where required.
Dimensions	Record rod diameter, internal width, bend radius, thread length and engagement.
Saddle/backing plate	Identify the matching plate and its bearing/contact arrangement.
Application	Record the retained component and whether the U bolt is structural or a rated lifting product.
Loads	Confirm permitted tension, shear and bending effects for the actual assembly.
Fasteners	Record nut/washer specification, tightening sequence and locking method.
Operating limits	Record all manufacturer/designer restrictions and the approved load arrangement.
Inspection / maintenance	Record pre-use checks, periodic inspections and servicing responsibilities; use the exact product instructions.
Documents / traceability	Attach applicable instructions, drawings, certificates and inspection/examination reports. Record reference and revision.

Important limitation

An ordinary U bolt is not automatically a rated lifting point. This sheet does not cover wire-rope clips; use the separate Wire Rope Clamps sheet.

4. Regulatory and good practice context

Topic	Application to record
Work equipment	Apply relevant PUWER duties for suitability, maintenance, inspection and safe use.
Lifting equipment	Assess the actual role in any lifting system. A fixed support or structural component should not be classified solely from its name or portal category.
Standards / instructions	Identify relevant product/structural standards and any BS EN 17206 machinery interface. Confirm applicable editions and scope; use maker/designer limits.

5. Pre-use and periodic inspection

Use competent personnel and a safe inspection method. These checks support the asset-specific regime; they do not replace maintenance or a statutory thorough examination. Record Pass / Fail / N/A and findings.

Check	What to confirm	Result / notes
Identification/records	Asset and configuration identifiable; instructions and previous defect actions available.	
Bend and legs	No cracks, spreading, bending damage or significant corrosion.	
Threads/nuts	Sound threads, adequate engagement and correct secure nuts.	
Seating	Correct plate; even contact without crushing the retained component.	
Application match	No added eye-loading or altered use outside the approved design.	
Change or damage history	Check for overload, impact, modification, repair or changed environment since last assessment.	
Safe function check	Where applicable, verify intended operation using an authorised safe procedure; do not improvise a proof-load test.	
Outcome/actions	Record defects, restrictions and actions; confirm who authorises return to use.	

6. Removal from service triggers

- Deformed legs/bend, damaged threads or loss of clamp force.
- Unidentified grade or attempted lifting use without evidence that the assembly is suitable.
- Damage, wear, corrosion or malfunction beyond the manufacturer/designer acceptance criteria, or uncertainty about safe condition.
- Suspected overload, significant impact or an unapproved modification: isolate the affected asset pending competent assessment.
- Tag and prevent use of unsafe equipment; record the defect and authorised repair/replacement and reinspection before return.

Inspection planning

Where LOLER applies, record the correct examination interval or a competent person's written scheme. Do not assume that an annual visual check is sufficient for every asset. Include examinations after relevant exceptional events.

7. Site-specific notes and limitations

Topic	Site entry / supporting document reference
Permitted loads / uses	
Prohibited uses / limits	
Location / environment	
Inspection / servicing plan	
Related assets / drawings	

8. Inspection and document record

Date	Check / document	Completed by	Outcome / action

Asset details verified by: _____ Date: _____

Release / approval reference: _____
