

WEDGE SOCKETS

Technical data / extra information sheet

Mechanical Theatre Equipment Compliance Portal

Purpose of this sheet

A technical record template for this equipment. Complete and review it using the actual manufacturer instructions, installation design, inspection records and site assessment. It does not certify an asset or assign a load rating.

1. Equipment identification

Field	Details
Equipment name	Wedge Sockets
Equipment category	Accessories
Manufacturer / supplier	To be confirmed for the actual asset.
Model / product variant	To be confirmed; include part number and version.
Asset / serial / batch ID	To be completed; attach a photograph of identification markings.
Site / location	To be completed.
Owner / responsible person	To be completed.
Status / record date	Generic template - asset details and approval outstanding. Date: _____

2. Description and typical use

A wire-rope termination using a matched socket body and wedge. Its suitability and assembly depend on the rope, socket design and manufacturer instructions.

- Use only for the attachment and load direction allowed for the identified product.
- Record the supported equipment and the complete load path to the building or lifting system.

3. Technical data to confirm

Enter confirmed values and the document/drawing reference in the asset record. WLL means working load limit. No numerical load rating is assigned by this sheet.

Parameter	Required confirmation
Matched components	Record socket, wedge and pin identities; confirm the parts form an approved set.
Wire rope	Record diameter, construction, grade and compatibility with the socket.
Termination rating	Confirm permitted rope/termination capacity and any efficiency allowance.
Rope routing	Record live-end orientation, dead-end length and retention arrangement from the manual.
Seating procedure	Record the approved initial seating and subsequent examination procedure.
Pin connection	Confirm pin retention, mating fitting dimensions and permitted alignment.
Operating limits	Record all manufacturer/designer restrictions and the approved load arrangement.
Inspection / maintenance	Record pre-use checks, periodic inspections and servicing responsibilities; use the exact product instructions.
Documents / traceability	Attach applicable instructions, drawings, certificates and inspection/examination reports. Record reference and revision.

Important limitation

Do not apply a universal tail length, termination efficiency or assembly method. Use the instructions for the exact socket and rope.

4. Regulatory and good practice context

Topic	Application to record
Work equipment	Apply relevant PUWER duties for suitability, maintenance, inspection and safe use.
Lifting equipment	Assess the complete lifting use under LOLER. Record the competent person's examination requirements and the appropriate equipment/accessory classification.
Standards / instructions	Identify relevant product/structural standards and any BS EN 17206 machinery interface. Confirm applicable editions and scope; use maker/designer limits.

5. Pre-use and periodic inspection

Use competent personnel and a safe inspection method. These checks support the asset-specific regime; they do not replace maintenance or a statutory thorough examination. Record Pass / Fail / N/A and findings.

Check	What to confirm	Result / notes
Identification/records	Asset and configuration identifiable; instructions and previous defect actions available.	
Component match	Correct identifiable body, wedge and pin; no substituted or modified parts.	
Rope seating	Routing, seating and tail retention agree with the exact product instructions.	
Body and pin	No cracks, spreading, severe wear, corrosion or insecure pin retention.	
Rope at entry/exit	No slipping or visible rope damage; arrange competent assessment where needed.	
Change or damage history	Check for overload, impact, modification, repair or changed environment since last assessment.	
Safe function check	Where applicable, verify intended operation using an authorised safe procedure; do not improvise a proof-load test.	
Outcome/actions	Record defects, restrictions and actions; confirm who authorises return to use.	

6. Removal from service triggers

- Mismatched parts, rope movement in service or uncertain seating/assembly.
- Cracked or distorted body, damaged pin or rope deterioration requiring withdrawal.
- Damage, wear, corrosion or malfunction beyond the manufacturer/designer acceptance criteria, or uncertainty about safe condition.
- Suspected overload, significant impact or an unapproved modification: isolate the affected asset pending competent assessment.
- Tag and prevent use of unsafe equipment; record the defect and authorised repair/replacement and reinspection before return.

Inspection planning

Where LOLER applies, record the correct examination interval or a competent person's written scheme. Do not assume that an annual visual check is sufficient for every asset. Include examinations after relevant exceptional events.

7. Site-specific notes and limitations

Topic	Site entry / supporting document reference
Permitted loads / uses	
Prohibited uses / limits	
Location / environment	
Inspection / servicing plan	
Related assets / drawings	

8. Inspection and document record

Date	Check / document	Completed by	Outcome / action

Asset details verified by: _____ Date: _____

Release / approval reference: _____
