UNIVERSAL SUSPENSION CLAMP

Technical data / extra information sheet

Theatre Equipment Hub

Purpose of this sheet
A technical record template for this equipment. Complete and review it using the actual manufacturer instructions, installation design, inspection records and site assessment. It does not certify an asset or assign a load rating.

1. Equipment identification

Field	Details
Equipment name	Universal Suspension Clamp
Equipment category	Suspension clamp / support accessory
Manufacturer / supplier	To be confirmed for the actual asset.
Model / product variant	To be confirmed; include part number and version.
Asset / serial / batch ID	To be completed; attach a photograph of identification markings.
Site / location	To be completed.
Owner / responsible person	To be completed.
Status / record date	Generic template - asset details and approval outstanding. Date: _____

2. Description and typical use

A suspension clamp connects a compatible support to a suspended item or connecting assembly; the permitted arrangement depends on the exact product.

- Universal is a product description, not approval for every tube size, support profile, load direction or use.
- Assess the clamp, connecting hardware, supported equipment and supporting structure as one complete load path.

3. Technical data to confirm

Enter confirmed values and the document/drawing reference in the asset record. WLL means working load limit. No numerical load rating is assigned by this sheet.

Parameter	Required confirmation
Manufacturer / model	Identify the exact clamp and the applicable instruction revision.
Support interface	Confirm permitted tube diameter or profile, material and contact arrangement.
Load rating / direction	Obtain the actual WLL/SWL and orientation limits. No value is assigned by this sheet.
Connecting hardware	Confirm thread size, fastener grade, engagement, washers and locking arrangement.
Tightening method	Record maker-specified torque or method; never infer it from bolt size alone.
Complete assembly	Confirm supporting structure and connected equipment capacity, load path and retention.
Operating limits	Record all manufacturer/designer restrictions and the approved load arrangement.
Inspection / maintenance	Record pre-use checks, periodic inspections and servicing responsibilities; use the exact product instructions.
Documents / traceability	Attach applicable instructions, drawings, certificates and inspection/examination reports. Record reference and revision.

Important limitation
The word universal does not establish compatibility or capacity. This general sheet contains no assumed load rating, tube size, thread size or tightening torque. Confirm all values for the actual asset.

4. Regulatory and good practice context

Topic	Application to record
Work equipment	Apply relevant PUWER duties for suitability, maintenance, inspection and safe use.
Lifting equipment	Assess the actual role in any lifting system. A fixed support or structural component should not be classified solely from its name or portal category.
Standards / instructions	Identify relevant product/structural standards and any BS EN 17206 machinery interface. Confirm applicable editions and scope; use maker/designer limits.

5. Pre-use and periodic inspection

Use competent personnel and a safe inspection method. These checks support the asset-specific regime; they do not replace maintenance or a statutory thorough examination. Record Pass / Fail / N/A and findings.

Check	What to confirm	Result / notes
Identification/records	Asset and configuration identifiable; instructions and previous defect actions available.	
Identity and suitability	Confirm product identity, instructions, permitted loading and compatibility with the actual support and connection.	
Body and contact surfaces	Inspect for cracks, bending, corrosion, excessive wear and signs of slipping or poor seating.	
Fasteners and threads	Check specified bolts, nuts, pins and retainers are present; threads are undamaged and engagement/locking meet instructions.	
Fit and tightening	Check correct seating and engagement; tighten only by the specified method. Do not use improvised packing or extensions.	
Support and load path	Inspect the support and mating hardware for damage; confirm capacity, load direction and any required secondary retention.	
Condition and records	Check for overload, impact, loose parts or unauthorised alteration; resolve outstanding defects before use.	
Change or damage history	Check for overload, impact, modification, repair or changed environment since last assessment.	
Safe function check	Where applicable, verify intended operation using an authorised safe procedure; do not improvise a proof-load test.	
Outcome/actions	Record defects, restrictions and actions; confirm who authorises return to use.	

6. Removal from service triggers

• Cracks, deformation, stripped threads, missing retainers or evidence of slipping.

• Unidentified product, unverified capacity or an installation outside documented limits.

• Damage, wear, corrosion or malfunction beyond the manufacturer/designer acceptance criteria, or uncertainty about safe condition.

• Suspected overload, significant impact or an unapproved modification: isolate the affected asset pending competent assessment.

• Tag and prevent use of unsafe equipment; record the defect and authorised repair/replacement and reinspection before return.

Inspection planning
Where LOLER applies, record the correct examination interval or a competent person's written scheme. Do not assume that an annual visual check is sufficient for every asset. Include examinations after relevant exceptional events.

7. Site-specific notes and limitations

Topic	Site entry / supporting document reference
Permitted loads / uses	
Prohibited uses / limits	
Location / environment	
Inspection / servicing plan	
Related assets / drawings	

8. Inspection and document record

Date	Check / document	Completed by	Outcome / action

Asset details verified by: _____ Date: _____

Release / approval reference: _____

Reference guidance
